1. Definition of Fuzzy Set

A fuzzy set A on universe (domain) X is a **set** defined by the **membership function** $\mu_A(x)$ which is a mapping from the universe X into the unit interval:

$$\mu_A(x) : X \rightarrow [0, 1]$$

$\mathcal{F}(X)$ denotes the set of all fuzzy sets on X

$$\mu_A(x) \begin{cases} = 1 & x \text{ is a full member of } A \\ \in (0, 1) & x \text{ is a partial member of } A \\ = 0 & x \text{ is not member of } A \end{cases}$$

2. Properties of Fuzzy Set

3. Operations of Fuzzy Set

3.1. Complement Union and Intersection

Complement

Let A be a fuzzy set in X . The complement of A is a fuzzy set, denoted \bar{A} , such that for each $x \in X$

$$\mu_{\bar{A}}(x) = 1 - \mu_A(x)$$

λ -complement

$$\mu_{\bar{A}}(x) = \frac{1 - \mu_A(x)}{1 + \lambda\mu_A(x)}$$

Intersection of Fuzzy Sets

Let A and B be two fuzzy sets in X . The intersection of A and B is a fuzzy set C , denoted $C = A \cap B$, such that for each $x \in X$

$$\mu_C(x) = \min(\mu_A(x), \mu_B(x))$$

The minimum operator is also denoted by \wedge , i.e., $\mu_C(x) = \mu_A(x) \wedge \mu_B(x)$

Union of Fuzzy Sets

Let A and B be two fuzzy sets in X . The union of A and B is a fuzzy set C , denoted $C = A \cup B$, such that for each $x \in X$

$$\mu_C(x) = \max(\mu_A(x), \mu_B(x))$$

The maximum operator is also denoted by \vee , i.e., $\mu_C(x) = \mu_A(x) \vee \mu_B(x)$

3.2. T-norms and T-conorms

T-Norm (Intersection)

A **t-norm** T is a **binary operation** on the unit interval that satisfies at least the following axioms for all $a, b, c \in [0, 1]$:

$$\begin{aligned} T(a, 1) &= a \quad (\text{boundary condition}) \\ b \leq c &\text{ implies } T(a, b) \leq T(a, c) \quad (\text{monotonicity}) \\ T(a, b) &= T(b, a) \quad (\text{commutativity}), \\ T(a, T(b, c)) &= T(T(a, b), c) \quad (\text{associativity}). \end{aligned}$$

Some frequently used t -norms are:

standard (Zadeh) intersection:	$T(a, b) = \min(a, b)$
algebraic product (probabilistic intersection):	$T(a, b) = ab$
Łukasiewicz (bold) intersection:	$T(a, b) = \max(0, a + b - 1)$

- **minimum** is the **largest t-norm** (intersection operator)
- means the membership functions of fuzzy intersections $A \cap B$ obtained with other t-norms are all **below** the bold membership function

T-Conorm(Union)

A **t-conorm** S is a binary operation on the unit interval that satisfies at least the following axioms for all $a, b, c \in [0, 1]$ (Klir and Yuan, 1995):

$$\begin{aligned} S(a, 0) &= a \quad (\text{boundary condition}) \\ b \leq c &\text{ implies } S(a, b) \leq S(a, c) \quad (\text{monotonicity}), \\ S(a, b) &= S(b, a) \quad (\text{commutativity}) \\ S(a, S(b, c)) &= S(S(a, b), c) \quad (\text{associativity}). \end{aligned}$$

Some frequently used t -conorms are:

standard (Zadeh) union:	$S(a, b) = \max(a, b),$
algebraic sum (probabilistic union):	$S(a, b) = a + b - ab,$
Łukasiewicz (bold) union:	$S(a, b) = \min(1, a + b) .$

- The **maximum** is the **smallest** t-conorm (union operator)
- the membership functions of fuzzy unions $A \cup B$ obtained with other t-conorms are all **above** the bold membership function

3.3. Projection and Cylindrical Extension

Projection reduces a fuzzy set defined in a multi-dimensional domain

Cylindrical extension extend of a fuzzy set defined in low-dimensional domain into a higher-dimensional domain

Projection

Let $U \subseteq U_1 \times U_2$ be a subset of a Cartesian product space, where U_1 and U_2 can themselves be Cartesian products of lowerdimensional domains. The projection of fuzzy set A defined in U onto U_1 is the mapping $proj_{U_1} : \mathcal{F}(U) \rightarrow \mathcal{F}(U_1)$ defined by:

$$proj_{U_1}(A) = \left\{ \sup_{U_2} \mu_A(u)/u_1 \mid u_1 \in U_1 \right\}$$

where sup is the supremum operation

The **supremum** (abbreviated sup; plural suprema) of a subset S of a partially ordered set T is the least element in T that is greater than or equal to all elements of S , if such an element exists. Consequently, the supremum is also referred to as the **least upper bound (or LUB)**.

Figure 2.9.: Example of projection from \mathbb{R}^2 to \mathbb{R} .

Example 2.4 (Projection) Assume a fuzzy set A defined in $U \subset X \times Y \times Z$ with $X = \{x_1, x_2\}$, $Y = \{y_1, y_2\}$ and $Z = \{z_1, z_2\}$, as follows:

$$A = \{ \mu_1/(x_1, y_1, z_1), \mu_2/(x_1, y_2, z_1), \mu_3/(x_2, y_1, z_1), \mu_4/(x_2, y_2, z_1), \mu_5/(x_2, y_2, z_2) \} \quad (2.31)$$

Let us compute the projections of A onto X , Y and $X \times Y$:

$$\text{proj}_X(A) = \{ \max(\mu_1, \mu_2)/x_1, \max(\mu_3, \mu_4, \mu_5)/x_2 \}, \quad (2.32)$$

$$\text{proj}_Y(A) = \{ \max(\mu_1, \mu_3)/y_1, \max(\mu_2, \mu_4, \mu_5)/y_2 \}, \quad (2.33)$$

$$\text{proj}_{X \times Y}(A) = \{ \mu_1/(x_1, y_1), \mu_2/(x_1, y_2), \mu_3/(x_2, y_1), \max(\mu_4, \mu_5)/(x_2, y_2) \}. \quad (2.34)$$

Cylindrical Extension

Let $U \subseteq U_1 \times U_2$ be a subset of a Cartesian product space, where U_1 and U_2 can themselves be Cartesian products of lower-dimensional domains. The cylindrical extension of fuzzy set A defined in U_1 onto U is the mapping $\text{ext}_U : \mathcal{F}(U_1) \rightarrow \mathcal{F}(U)$ defined by

$$\text{ext}_U(A) = \{ \mu_A(u_1) / u \mid u \in U \}$$

- Cylindrical extension thus **simply replicates** the membership degrees from the existing dimensions into the new dimensions.

Figure 2.10.: Example of cylindrical extension from \mathbb{R} to \mathbb{R}^2 .

Properties

- **projection** leads to a **loss of information**, so we have

$$A = \text{proj}_{X^n} (\text{ext}_{X^m} (A))$$

$$A \neq \text{ext}_{X^m} (\text{proj}_{X^n} (A))$$

3.4. Operations on Cartesian Product Domains

Set-theoretic operations such as the **union or intersection** applied to fuzzy sets **defined in different domains** result in a **multi-dimensional fuzzy set** in the Cartesian product of those domains.

- first **extending** the original fuzzy sets into the Cartesian product domain
- then **computing the operation** on those multi-dimensional sets.

Figure 2.11.: Cartesian-product intersection.

Example 2.5 (Cartesian-Product Intersection) Consider two fuzzy sets A_1 and A_2 defined in domains X_1 and X_2 , respectively. The intersection $A_1 \cap A_2$, also denoted by $A_1 \times A_2$ is given by:

$$A_1 \times A_2 = \text{ext}_{X_2}(A_1) \cap \text{ext}_{X_1}(A_2). \quad (2.38)$$

This **cylindrical extension is usually considered implicitly** and it is not stated in the notation:

$$\mu_{A_1 \times A_2}(x_1, x_2) = \mu_{A_1}(x_1) \wedge \mu_{A_2}(x_2). \quad (2.39)$$

Figure 2.11 gives a graphical illustration of this operation.

4. Fuzzy Relations

An n-ary **fuzzy relation** is a **mapping**

$$R: X_1 \times X_2 \times \cdots \times X_n \rightarrow [0, 1]$$

which assigns membership grades to all n-tuples (x_1, x_2, \dots, x_n) from the Cartesian product $X_1 \times X_2 \times \cdots \times X_n$.

- For **computer implementations**, R is conveniently

represented as an **n-dimensional array**: $R = [r_{i_1, i_2, \dots, i_n}]$

- A **fuzzy relation** is a **fuzzy set** in the Cartesian product $X_1 \times X_2 \times \dots \times X_n$. The membership grades represent the degree of association (correlation) among the elements of the different domains X_i .

Figure 2.13.: Fuzzy relation $\mu_R(x, y) = e^{-(x-y)^2}$.

5. Relational Composition

The **composition** is defined as follows : suppose there exists a fuzzy relation R in $X \times Y$ and A is a fuzzy set in X . Then, fuzzy subset B of Y can be **induced** by A through the composition of A and R :

$$B = A \circ R$$

And is defined by:

$$B = \text{proj}_Y (R \cap \text{ext}_{X \times Y}(A))$$

Understanding

The composition can be regarded in two phases:

- combination(intersection)
- projection

sup-min composition

$$\mu_B(y) = \sup_x (\min (\mu_A(x), \mu_R(x, y)))$$

More general form

$$\mu_B(y) = \sup_x (T(\mu_A(x), \mu_R(x, y)))$$

the T means a t-norm

Example

Example 2.8 (Relational Composition) Consider a fuzzy relation R which represents the relationship “ x is *approximately equal* to y ”:

$$\mu_R(x, y) = \max(1 - 0.5 \cdot |x - y|, 0) . \quad (2.45)$$

Further, consider a fuzzy set A “*approximately 5*”:

$$\mu_A(x) = \max(1 - 0.5 \cdot |x - 5|, 0) . \quad (2.46)$$

Suppose that R and A are discretized with $x, y = 0, 1, 2, \dots$, in $[0, 10]$. For a discrete set

max is equivalent to **sup**. Then, the composition is:

$$\begin{aligned}
 \mu_B(y) &= \overbrace{(0 \ 0 \ 0 \ 0 \ \frac{1}{2} \ 1 \ \frac{1}{2} \ 0 \ 0 \ 0 \ 0)}^{\mu_A(x)} \circ \overbrace{\begin{pmatrix} 1 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 1 \end{pmatrix}}^{\mu_R(x,y)} = \\
 &= \max_x \overbrace{\begin{pmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & \frac{1}{2} & 1 & \frac{1}{2} & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix}}^{\min(\mu_A(x), \mu_R(x,y))} = \\
 &= \overbrace{(0 \ 0 \ 0 \ \frac{1}{2} \ \frac{1}{2} \ 1 \ \frac{1}{2} \ \frac{1}{2} \ 0 \ 0 \ 0)}^{\max_x(\min(\mu_A(x), \mu_R(x,y)))}
 \end{aligned}$$

In this graph, different column means different x

This resulting fuzzy set, defined in Y **can be interpreted as “approximately 5”**. Note, however, that it is **broader (more uncertain)** than the set from which it was induced. This is because the combination of uncertainty in input fuzzy and relation
